

# THE SILENT PARTNER

The vitality of the head depends on your attention:

1. Replenishing the head itself with water through the hole at the top. Usually once in three days is sufficient, filling to reach about 3cm under the rim. Once per month we recommend fertilizing the water with a liquid fertilizer. The *soleiloria soleilorii* vegetation prospers when sprinkled using a water spray with a fertilizer mixed in (measure out according to the manufacturer's instructions); best in the evening, as direct sunlight would cause steaming.
2. Cutting the vegetation to the desired shape.
3. Placing your Silent partner to a place with the most intense daylight. Direct sunlight is fine; in darker spaces the vegetation thins out.

With this attention your Silent partner will grow for many years. The ceramic head can be replanted.  
Good luck!
